

Capstone Project 2: NLP Track - Youtube – Finding the most applicable content for a specific topic – Tom Preston

Study Background:

Millions of people use Youtube daily for learning how to do things. Diverse topics from how to replace a watch battery to how to learn Python is available however you often have to sift through lots of videos to find the “really good ones”. I personally use Youtube (YT) daily for finding training materials on Python and Data Science. My challenge is that YT’s search is helpful but the search options are based on “relevance” (proprietary algorithm determined by YT), view count, and ratings. I would like a better way to assess and prioritize the content I am looking for.

My goal for this Capstone is to use the YT API to read in the video title, summary description, comments and likes / dislikes to find relevant content more quickly. I will use NLP techniques to review the document titles, summaries and comments to rank these videos to determine their relevance to my search criteria. I tested this on a subject like python (a subject I personally spend a lot of time in YT looking at) to see if this approach improves upon my manual searches.

I defined a set of queries below that are meant to be broad topics around two different topic areas, python and golf. Below is the initial set of draft queries.

Python Queries	
Python tutorial	Python dictionaries
Python reading CSV files	Python sort functions
Python pandas DataFrames	Python for loops
Python lists	Python tuples

Data Source

YT provides an API to search videos and extract statistics. The API accepts different types of queries and provides a nested dictionary of the results. There are a few challenges when using the YT API. First, you have to go to [developers.google.com](https://developers.google.com/youtube/) and register your email address to get an API key. This API key has to be part of the data query to YT. Second, the YT API query and related error messages are not very intuitive on how to use or troubleshoot. This YT method creates a `googleapiclient.discovery.Resource` type when must be instantiated before running queries.

Data Wrangling:

Data Setup and Cleaning

The three main YT queries are video searches (using a search phrase), statistics query, and the comments query.

Video Searches: A call to the YT API with a search query returns a standard python dictionary of search requests. The query returns up to 50 videos based on relevance to the query. The “relevance” is a proprietary YT algorithm. The “query_results” response has a nested dictionary for each video (see below). Key items (shown below) are the video Id, title, and description. Also, this query has over 1,000,000 results and YT only allows you to request 50 results per query. A function using the nextPageToken allow a user to request a series of continuous results. An extract of the query result is shown below.

Query_results – first nested dictionary entry (key items bolded):

```
{'kind': 'youtube#searchListResponse',
 'etag': '"p4VTdlkQv3HQeTEaXgvLePAYdmU/XzqcriHV8BFFo0Vqw6zP2YmSLYc"',
 'nextPageToken': 'CDIQAA',
 'regionCode': 'US',
 'pageInfo': {'totalResults': 1000000, 'resultsPerPage': 50},
 'items': [{'kind': 'youtube#searchResult',
  'etag': '"p4VTdlkQv3HQeTEaXgvLePAYdmU/z11WbGTNgEvyDRL_DFX3UN5ZeyQ"',
  'id': {'kind': 'youtube#video', 'videoid': 'rfscVS0vtbw'},
  'snippet': {'publishedAt': '2018-07-11T18:00:42.000Z',
   'channelId': 'UC8butISFwT-Wi7EV0hUK0BQ',
   'title': 'Learn Python - Full Course for Beginners [Tutorial]',
   'description': "This course will give you a full introduction into all of the core concepts in python. Follow along with the videos and you'll be a python programmer in no time!",
   'thumbnails': {'default': {'url': 'https://i.ytimg.com/vi/rfscVS0vtbw/default.jpg',
    'width': 120,
    'height': 90},
    'medium': {'url': 'https://i.ytimg.com/vi/rfscVS0vtbw/mqdefault.jpg',
     'width': 320,
     'height': 180},
    'high': {'url': 'https://i.ytimg.com/vi/rfscVS0vtbw/hqdefault.jpg',
     'width': 480,
     'height': 360}},
   'channelTitle': 'freeCodeCamp.org',
   'liveBroadcastContent': 'none'}}],
```

Video Requests Data Wrangling. I initially queried the top 50 results for each search query. After reviewing the results, analyzing the first 25 queries is reasonable. As shown in appendix A, for all eight python queries, the first 5 – 10 typically have significantly more views. In my analysis, the queries 25 – 50 often do not have enough views or comments to provide much insights. The results 11 – 25 typically do have enough information (views, comments, etc) to be useful in the analysis.

The age of each video is calculated in weeks using the datetime module. It's assumed that newer videos will probably not be the most viewed however their ratio of likes to views might

identify promising new videos which are exactly the ones I am trying to find by adjusting the search criteria. The video request information is exacted into a list and then converted into a pandas DataFrame to be merged with the statistics information.

Video Statistics: The second query is the video statistics query where a video id (each YT video has a unique alpha-numeric video id) is required to retrieve the video statistics (view count, like count, dislike count and comment count). The video IDs are exacted from the initial video search query results and then combined into a single string. The YT statistics query allows a user to query video statistics either via single or group requests. To be a “good” user, I ask for the video statistics in one group request instead of 25 individual requests for each of the 8 python queries.

Video Statistics Result (key items bolded):

```
{'kind': 'youtube#videoListResponse',  
'etag': '"p4VTdlkQv3HQeTEaXgvLePAydmU/qiy6k0yl5Y3g3e2QvCZEX05VHlk"',  
'pageInfo': {'totalResults': 50, 'resultsPerPage': 50},  
'items': [{'kind': 'youtube#video',  
'etag': '"p4VTdlkQv3HQeTEaXgvLePAydmU/0UAojlcSxzPMfuQXkS_PxoeHKmc"',  
'id': 'q5uM4VKywbA',  
'statistics': {'viewCount': '327156',  
'likeCount': '4973',  
'dislikeCount': '51',  
'favoriteCount': '0',  
'commentCount': '364'}},  
{'kind': 'youtube#video',  
'etag': '"p4VTdlkQv3HQeTEaXgvLePAydmU/0--4nW9re9Qy8_Cjvdu-hVyrET8"',  
'id': 'Xi52tx6phRU',  
'statistics': {'viewCount': '259361',  
'likeCount': '4764',  
'dislikeCount': '126',  
'favoriteCount': '0',  
'commentCount': '301'}}
```

Video Statistics Data Wrangling: As shown above, the YT video statistics query returns a nested dictionary entry for each video. The information is exacted into a list and then converted into a pandas DataFrame. This information is then merged with the video statistics to create one DataFrame per query.

The query below (Python query 1 – “python tutorial”) is broad query. As shown by the 9M views for the first result, it’s by far the most viewed. After the top 5, the view count drops off steadily. Interestingly, as a user scroll down the results list, YT will keep showing the video results but after about 30 – 40 results, the results are not as relevant to the search criteria.

Python query 1 – “python tutorial” Top 25 results:

The next query below (Python query 8 – “python tuples”) is a more specific python related query. The first result only have 167K views and after the seventh query, the number of view drops off steady. These are the type of focused queries where other ways to rank the video could move it up on the results list.

Extracting the dictionary data into dataframes took some effort to optimize the code and the queries. One interesting challenge is the fact the video owners can turn off comments on their videos. When this happens, there are no statistics for likes, dislikes, or comments. YT just skips that information in the dictionary response, and I had to check for that condition and put zeros in the impacted fields.

Video Comments: The third query is the video comments query. This extracts the first 100 comments (selecting by relevance) for each video, populates lists to hold the comments, and then creates a dataframe. The dataframe is exported to excel.

Video Comments Search Query Results (key items bolded:

As shown in the query statistics above, each video can have as many as 11K comments (line 1 of the Python query 1) or as few as 3 comments (line 18 of the Python query 8). For this study, I am just extracting up to the first 100 ‘relevant’ comments. If I took the most recent comments by date posted, that might provide a different view of the comments. However, given the relatively low numbers of dislikes across the video sample I see video statistics on the next page), I observed most comments are either mostly positive or a question / comment (i.e. – “can you do a video on X topic....”, “can you explain your comment about Y at Z:ZZ in the video). Most people won’t write too negative of a comment, especially for python coding topics.

The comments extract above highlights the challenges with reviewing the comments. A majority will be generally positive and the others typically fall into 2 categories (a question or a comment). The key is to focus on the positive comments (ie. – “great video”, “very clear instruction”, etc). It’s easy for a YT viewer to just click the Like button but taking the time to type in a positive comment shows an extra level of praise for the video content.

Data EDA & Analysis:

Python Query Summary Video Statistics: The Python queries video statistics table below shows the total number of views (46.8M), likes (947K) and dislikes (14K) for the 8 python related queries. In aggregate, the videos only averaged getting 1.6% of likes compared to the total views. Since the total number of dislikes is also very small, the ratio of dislikes to likes is just 1.8% (meaning for 1,000 likes, on average there is only 18 dislikes for the top 25 videos).

The comments numbers are even smaller. Across the whole population, there was only 65K comments vs. 46.8M views (0.1%). If people are going to take the time to write a comment, they should have extra weighting in the search results. I extracted the top 100 “relevant” comments from each of the top 25 videos from the eight python queries for a total of 8,492 (13%) comments across 200 videos (65K total comments). For the top viewed videos, it’s a pretty small subset of the comments but for the top 10 – 25 videos for each query, often, they had less than 100 total comments for the less viewed videos.

Python Query Summary Video Statistics:

Python Query	Total Views for top 25 results	Total Likes for top 25 results	Total Dislikes for top 25 results	Total Comments	Total Extracted Comments	Hand Tagged Comments
1) Python tutorial	33,728,573	751,794 (2.2%)	10,921 (1.5%)	48,307	2,366 (5%)	595

2) Python reading CSV files	2,231,893	27,462 (1.2%)	616 (2.2%)	2,263	808 (36%)	264
3) Python pandas DataFrames	1,214,931	18,761 (1.5%)	378 (2.0%)	1,912	721 (38%)	111
4) Python lists	2,956,419	50,627 (1.7%)	616 (1.2%)	3,869	1,282 (33%)	50
5) Python dictionaries	1,650,572	28,577 (1.7%)	472 (1.7%)	2,170	1,016 (47%)	25
6) Python sort functions	419,081	7,567 (1.8%)	185 (2.4%)	678	432 (64%)	25
7) Python for loops	3,195,745	36,107 (1.1%)	836 (2.3%)	4,358	1,184 (27%)	25
8) Python tuples	1,443,193	26,187 (1.8%)	329 (1.3%)	1,801	683 (38%)	25
Totals:	46,840,407	947,082 (1.6%)	14,353 (1.8%)	65,358 (0.1%)	8,492 (13%)	1,120 (13%)

I hand tagged 1,120 comments (1 = positive, 0 = other) to develop a train-test data set to classify the other videos comments. I will classify the remaining 7,372 comments to see if these classifications will help determine if the percentage of positive comments might be used to alter the YT video search rankings.

Python Query Analysis: The video statistics data from each of the 8 separate python queries is graphed in Appendix A. The following metrics were gathered for each of the top 25 videos: age (calculated in weeks), total views, total likes (i.e. – a user clicks on the thumbs up icon), total dislikes (i.e. – a user clicks on the thumbs down icon), and total comments (a user posts a comment and his YT user id is also posted).

The chart for Python Query 2 – “python reading CSV files” is indicative of the 8 charts in Appendix A. The key observations are:

Age: The top 5- 10 videos are typically 1 – 2 years old. The top 11 – 25 videos age can vary widely (brand new to several years old).

Like Count: As shown in the video statistics summary table above, each video receives on average 1.6% likes per view ratio (for 1,000 views, it will get 16 likes). The 5-8 videos get the most likes and it then steadily drops from there. When a user search YT, the first few videos show up in the search results. Once a user selects 1 video, another 5 – 6 show up in a sidebar view. Most users probably just view the videos where they see the video listed on the main landing page and they do not seem to search manually through the results list.

The significance of this result is that unless a video makes the top 5 – 8 results, it will be difficult for it to make it to the top of the search results.

Dislike Count: While the total like count is approximately 1.6% of the total view count, the total dislike count is only 1.8% of the like count. This number is so small, it's off limited value.

Comments Count: Users comment on only 0.1% of all views (1 comment per 1,000 views). After personally reviewing and tagging 1,120 python query comments, there is a definitely pattern to the comments. A majority (estimate 75%) are positive comments and another 20% are questions / comments. Certain videos that provide unclear python coding demonstrations which might be confusing or have errors generate a large number of questions in the comments section.

The key here is seeing which comments have a vast majority of positive comments. Certain videos channels (Corey Schafer, Socratica, etc.) get very positive reviews for their valuable content.

Overall, the charting of these metrics across the 4 key data points (views, likes, dislikes, comments) all follow a similar pattern – the views set the pattern and the likes, dislikes, and comments data is in proportion to the views.

The Python Query 2 (reading CSV files) does show an interesting data spike in video 23. The video is listed in the 23 query result yet it has the highest views (200K more than the number 1 video) as well as more likes, more comments and less dislikes. Upon reviewing the data, the video in question is from the python exper Corey Schafer. I have personally viewed many of his videos and they are always excellent.

The highlights a key issue around video title and video description relevance in the YT search query. Interestingly Corey Schafer is the author of the number 1 ranked video for reading CSV files. His video title and video description both mention “reading CSV files”. His 23rd ranked video is called “reading files in python”. It does not mention CSV files in either the video title or description. This shows that the video title and description relevance is key to video ranking even when a similar video has literally 200K more views.

Python Query 2: “Python reading CSV files”

P2 python reading CSV files

Machine Learning Application

As highlighted above, YT provides video search results based off a proprietary algorithm using multiple features (video title, video description, analysis of the video transcript, view counts, like counts, dislike counts, and user viewing history). While some of the view statistics are available to user analysis, many other items (video transcripts, user viewing history) are not available via the YT api. In addition, the YT api only exports the first 175 characters of the video description.

Naïve Bayes: YT does export the entire length of each video comment. I will apply Naïve Bayes to classify the comments as either '1' (a positive comment about the video) or '0' (either a question, basic statement, or unrelated statement). The YT summary statistics table above shows that comments are a small percentage of the total views however I will be using the positive comment count as a way to reorder the top 25 video results for each of the 8 python queries in an effort to more quickly find relevant content.

I hand tagged 1,120 comments out of the 8,492 extracted comments. While I initially thought the comments would be predominantly positive, my manual assessment found 635 (57%) positive and 485 (43%) other comments.

Manually Flagged Comments Distribution

Comment Type	# / %	Observations
Positive	635 (57%)	Very similar types of comments – “great job, great video, I learned a lot”, etc – generally very concise and very positive.
Other	485 (43%)	Broad range of comments often more editorial than praising the video. Also, if a video is showing how to code something in python and it's confusing, there will be many questions in the video comments.

I trained and tested the 1,120 classified comments using sklearn Naïve Bayes. The 75/25 train test split trained on 840 comments and tested on 280 comments. **The overall accuracy score is 78%.** The confusion matrix is below.

Naïve Bayes Confusion matrix – 280 obs.		
121 Other Comments	62 (true positive)	59 (false positive)
159 Positive Comments	2 (false negative)	157 (true negative)

An analysis of the false positives showed that when people included a positive comment and a question, Naïve Bayes would mislabel them. Also, people would request other videos (i.e. – please do a video on python lambda functions) and these would also be false positives. The two false negatives also had a mix of positive comments and questions.

The document term matrix was analyzed to determine the top 20 tokens for positive comments. A “positive ratio” (# of times a token was in a “positive” statement / # of times the token was in an ‘other’ statement) was calculated for each token. The table below is indicative of the positive tokens we would expect for positive feedback on a video (i.e. – thank you very much, great video, awesome video, you are a great teacher, etc.).

Top 20 Positive Comment Tokens

Token	Positive Count	Other Count	Ratio
thank	157.0	11.0	14.272727
much	78.0	6.0	13.000000
awesome	36.0	3.0	12.000000
excellent	23.0	2.0	11.500000
very	80.0	7.0	11.428571
best	55.0	5.0	11.000000
amazing	30.0	3.0	10.000000
great	78.0	8.0	9.750000
videos	60.0	7.0	8.571429
watched	17.0	2.0	8.500000
simple	15.0	2.0	7.500000
teacher	22.0	3.0	7.333333
far	14.0	2.0	7.000000
useful	13.0	2.0	6.500000
clear	19.0	3.0	6.333333
helped	12.0	2.0	6.000000
really	41.0	7.0	5.857143
2017	11.0	2.0	5.500000
thanks	117.0	23.0	5.086957
wonderful	10.0	2.0	5.000000

Improving Prediction Accuracy: The Naïve Bayes model was 78% accurate. There are several options in the sklearn Naïve Bayes Count Vectorizer to adjust to improve overall model accuracy.

CountVectorizer comes with several default parameters as shown below.

```
CountVectorizer(analyzer='word', binary=False, decode_error='strict',
               dtype=<class 'numpy.int64'>, encoding='utf-8', input='content',
               lowercase=True, max_df=1.0, max_features=None, min_df=1,
               ngram_range=(1, 1), preprocessor=None, stop_words=None,
               strip_accents=None, token_pattern='(?u)\b\w+\b',
               tokenizer=None, vocabulary=None)
```

The table below shows the additional parameter setting tested to improve prediction accuracy. These items were tested 1 at a time (ie – just one adjustment to the default parameters for each test)

CountVectorizer Parameter Testing

Parameter	Description	Prediction Impact
Default	Default Settings	78.2% (baseline)
Lowercase = false	Do not make all tokens lowercase	74.2% (-4%)
Ngram_range = (1,2)	Use 1 and 2 word ngrams	77.8% (-0.4%)
Max_df = 0,5	Ignore terms that appear in 50% 2.8% of the documents	78.2% (no change)
Min_df = 2	Term must appear in at least 2 documents	81.0% (2.8% increase)
Combining 2 settings: Ngram_range = (1,2) Min_df = 3	Use 1 and 2 word ngrams Term must appear in at least 2 documents	82.8% (4.6% increase)

By using Ngram_range = (1,2) and Min_df = 3, the accuracy was increased from 78.2% to 82.8% (4.6% increase). This is the final settings to use for predicting the type of the remaining untagged 7,372 comments)

Comment Prediction:

Using the Naïve Bayes CountVectorizer settings above, the remaining untagged 7,372 comments were processed and their comment type was predicted. The Naïve Bayes provides a prediction percentage from 0.0 to 1.0. The table below summarized the probability distribution.

Bayes Probability	Comment Count	Comment Disposition
(0.9, 1.0]	3851	Positive
(0.8, 0.9]	305	Positive
(0.7, 0.8]	166	Other
(0.6, 0.7]	129	Other
(0.5, 0.6]	293	Other
(0.4, 0.5]	126	Other
(0.3, 0.4]	136	Other
(0.2, 0.3]	188	Other
(0.1, 0.2]	252	Other
(0.0, 0.1]	1926	Other
	7,372 (Total Comments)	

I used a Bayes probability of .80 or higher to flag a comment as either Positive or Other. The Bayes prediction comment distribution is very similar to the manually flagged distribution.

Comment Type	Manually Flagged	Bayes Prediction (>= .80 = Positive Comment)	Totals
Positive	635 (57%)	4156 (56%)	4,791
Other	485 (43%)	3216 (44%)	3,701
Total:	1,120	7,372	8,492

With the 8,492 comments all being tagged or predicted as Positive or Other type comments, this information is merged with the YT summary statistics (each comment is tied to a video id) to be used in the video ranking analysis.

Positive Comments Sorted by Highest Number

Query N	Query_x	Search Rank	Channel	Video ID	Video Title	Video Age	view count	like count	dislike count	comment count	Very_Pos

The table above showed the videos with the most positive comments (Very_Pos column – far right of the table) show out of the 8,492 comments, the top 6 videos account for 1,065 of those comments. The videos also show up in multiple python queries (same video id for the different video queries). This highlights that video authors (Channels column above) such as Corey Schafer, Joe James, Socratica, and Keith Galli all seem to provide well liked python related content. I've seen videos from all of these authors and I personally think they all provide high caliber content.

After the top 6 Very_Pos comments counts, the remaining Very Pos comment counts evenly progresses from the 92 positive comments down to 0 positive comments in the remaining video summary statistics. I will use the non-normalized Very_Pos count in my final query reranking approach.

Fuzzy Matching: The second analysis item is determining if the video title and video description are close matches to the search term and if combining this information with the number of positive comments is a viable way to find more relevant videos in YT.

Fuzzywuzzy is a python method that uses the Levenshtein Distances to calculate the difference between text sequences. Fuzzywuzzy has 4 separate options in calculating text sequence differences.

Ratio Type / Query Notation	Description	Comment
Ratio (Title_R1, Descrip_R1)	Compares full query to full text	Needs exact query match for high ratio. Very sensitive to minor differences in word order and text length
Partial ratio (Title_R2, Descrip_R2)	Compares partial query to full text	Provides higher score for partial text matches.
Token_set ratio (Title_R3, Descrip_R3)	Breaks query and text into tokens and matches the sorted intersection	Provides most flexibility for sorted intersections of tokens.
Token_sort ratio (Title_R4, Descrip_R4)	Breaks query and text into tokens, sorts token and text and then calculates the match	More flexible but longer strings provide poor matching against shorter queries

The 4 ratios were calculated for each python query against both the video title and the video description. The table below is a subset of the 200 videos analyzed with Fuzzy Matching. After a review of the data, using the Title Set_Ratio (Title_R3 below) and the Description Set_Ratio (Descrip_R3 below) provided the best overall match scores for the videos. This is important for the less watched videos to get a higher matching score here in an effort to improve their query results ranking.

FuzzyMatching (python query vs video title and video description)

Query Num	Query	Search Rank	Video ID	Video Title	Video Description	Title_R1	Title_R2	Title_R3	Title_R4	Descrip_R1	Descrip_R2	Descrip_R3	Descrip_R4

As shown in the fuzzy matching table above, the Title Set Ratio (Title_R3) and the Description Set Ratio (Descrip_R3) generally have the best (highest) scoring ratio across the videos. I used these ratios as they give the videos lower in the Top 25 video results the best chance of scoring well with these ratios if their titles and descriptions contain the proper information related to the query. I reviewed these scores across all 200 video query results and the Title_R3 and Description_R3 provide the lesser watched videos the best chance of moving up in the video query rankings.

New Video Query Ranking Approach

As discussed above, YT has a proprietary algorithm to search videos. Often, the video with the highest view counts are near or are at the top of the search results. It's hard for the lower tier (say the videos in search position 10 – 25 of the top 25 results) to be viewed. I created a new scoring approach to find more relevant videos

Fuzzy Matching: By calculating the token sort ratio on the video title and video description, there are 2 results for each video (0-100 score) for both the video title and video description match.

Total Positive Comments: I used Naïve Bayes to classify 7,372 comments as Positive or Other comment types and I hand flagged another 1,120 comments. I am using each videos raw number of Positive comments as another indicator. Since a person must take the time to write and post a positive comment tied to their user name, I think the raw number of comments is important. Give the small percentage of comments, doing a normalization of positive comments to total views could yield different results however given that I only used 13% (8,492) of the 65K comments, the raw numbers of positive comments will be sufficient.

New Ranking Indicator Formula: The title and description fuzzy match ratios are averaged together and the positive comments is added to this to create a new score.

The first highlighted row from the Query 1 results shows Corey Schafer's python tutorial new score as the first video in the new ranking for Python Query 1 (first row in yellow below). The calculation for Corey Schafer's video is below:

Title_R3 Score	Descrip_R3 Score	Very_Pos Count	New Score
100	100	156	$(100+100)/2 = 100$ $+ 156 = 256$

The second highlighted row from the Query 1 results shows that the YT query result listed the python tutorial from FreeCodeCamp.org as the first result however in the new ranking, it's in position 19 of 25 with the new scoring approach. The calculation for the FreeCodeOrg is below:

Title_R3 Score	Descrip_R3 Score	Very_Pos Count	New Score
100	57	46	$(100+57)/2 = 78.5$ $+ 46 = 124.5$

Python Query 1 New Score and New Results Ranking

As shown in the table above, the new scores created a new ranking. The second far right column (New_Score – in Orange) show the new scores in descending order and the New_Order (far right column in yellow) shows the new order from 1-25 for the Python Query 1.

The main goal of this study was to find more relevant content, especially from less viewed videos. The YT search ranking (far left column in yellow) shows the several video that were not originally in the YT top 10 are now in the new order top 10. A user still needs to review these videos to see what video channels consistently provide the best content. Seeing the new scores and the channels which tend to be the most popular (Corey Schafer, Joe James, Socratica, etc) provides the viewer with additional content to view and a way to rank these videos.

Appendix B contains the new sort order for all 8 python queries based on the new scoring approach.

Conclusion

The video results YT provides based on “relevance” does provide a user a good list of video search results but often the most viewed videos populate the top of the list while excellent but less watched videos may struggle to be seen. The study showed that YT has lots of metrics (views, like count, dislike count, total comments) but additional steps need to be taken to create new rank approaches.

Comments provide a rich source of feedback on a video and using Naïve Bayes, this study quantified the number of positive comments. This was combined with fuzzy matching on the video titles and descriptions to create a new video ranking indicator which did move some of the lesser watched quality videos higher in the ranking.

While this study showed you can apply machine learning to classify comments and develop new ranking, video creators still to create high quality videos that will make users want to leave positive comments and drive more views.
